

What is West Nile virus?

West Nile virus (WNV) is a common virus spread by mosquitoes in the United States. WNV was first detected in California in 2003 and is now established throughout the state. WNV transmission to people usually happens in summer and early fall when temperatures are warm and mosquitoes are active. This virus can make people sick and can lead to death.

Which mosquitoes spread West Nile virus?

Several species of *Culex* mosquitoes spread WNV when they bite. *Culex* mosquitoes are common in California.

Approximate size

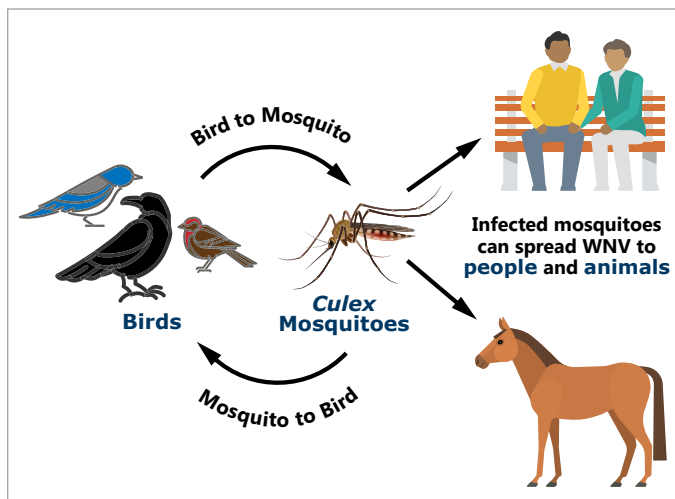

Culex mosquitoes usually feed on birds, which are the main source of WNV for mosquitoes. These mosquitoes will also bite people and can spread WNV to them. People and other animals cannot spread WNV.

What are the symptoms of West Nile virus?

- Most people (about **80%**) infected with WNV do not have symptoms.
- Some people (about **20%**) infected with WNV will become sick with symptoms such as fever, headache, and nausea. Usually people recover completely, but some people may feel tired and sick for weeks.
- A few people (less than **1%**) infected with WNV will become very sick. In these cases, the virus affects the brain and/or nervous system. Symptoms include vision loss, numbness, and paralysis. WNV can be fatal.

WEST NILE VIRUS TRANSMISSION

Who is most at risk of becoming very sick from West Nile virus?

- People over the age of 60 years
- People with weakened immune systems
- People with diabetes, kidney disease, or some other medical condition

These groups should take extra precautions to avoid mosquito bites. See your doctor if you think you have WNV.

Mosquito-bite prevention

Use repellent

Stay covered

Fix screens

Drain water

Why are birds important?

Many types of birds carry WNV and can die from infection. This makes them good indicators of where WNV is active.

If you find a dead bird, please report it to the WNV and Dead Bird Hotline toll-free at 1-877-WNV-BIRD (1-877-968-2473) (available from mid-April to mid-October) or by filling out a report online at www.westnile.ca.gov (available year-round). If the bird meets the criteria for testing, someone will contact you to arrange a pickup. All dead bird reports are useful, even if some birds cannot be tested.

Two common birds likely to get WNV include:

American Crow

16-21 inches

California Scrub-Jay

11-12 inches

More bird photos can be seen on the online report form: www.westnile.ca.gov

Do other animals get West Nile virus?

Yes. WNV can cause severe illness in **horses** and even death. Symptoms include stumbling, muscle twitching, and reduced appetite. **A WNV vaccine for horses is available and strongly recommended.**

A **dog or cat** may occasionally get WNV, but dogs and cats usually do not become sick. Talk to your veterinarian if you are concerned about your pet.

Protect yourself and others from WNV!

- Prevent mosquito bites — apply insect repellent with EPA-registered active ingredients **DEET**, picaridin, IR3535, or oil of lemon eucalyptus before you go outside. Be sure to follow label directions.
- Wear long-sleeved shirts, long pants, and insect repellent if spending time outside at **DAWN** and **DUSK**. Mosquitoes that spread WNV are most active at those times.
- Install **DOOR** and window screens, and repair any ripped or torn screens to keep mosquitoes out of your home.
- **DUMP** and **DRAIN** standing water around your yard (WNV mosquitoes lay their eggs on standing water). Change water in pet dishes, birdbaths, and wading pools at least once a week. Keep gutters free from debris.
- Contact your local mosquito and vector control agency if you are being bothered by mosquitoes where you live or work.

Dump out all standing water in your yard.

How is California working to prevent the spread of West Nile virus?

California's comprehensive WNV surveillance program incorporates more than dead bird testing. Mosquitoes and sentinel chickens are also tested for WNV. Blood from human blood donors is also screened. All of this information helps local agencies know where they need to focus their mosquito control efforts to reduce the risk of people getting infected by WNV.

The California West Nile Virus Surveillance Program is a collaboration between the California Department of Public Health, mosquito and vector control agencies, local health departments, and the University of California, Davis.

Thank you for helping to track and prevent West Nile virus in California.
